Q. no. 18 write short notes:

a. project schedule.

Project scheduling is a mechanism to communicate what tasks need to get done and which organizational resources will be allocated to complete those tasks in what timeframe. A project schedule is a document collecting all the work needed to deliver the project on time.

A project is made up of many tasks (and each task is given a start and end data (or due date), so it can be completed on time. likewise, people have different schedules, and their availability and vacation or leave dates need to be documented in order to successfully plan those tasks. (ग्रन्थ → यस गर्न मात्र मात्रै हुन्छ)

The project schedule should reflect all of the work associated with delivering the project on time. without a full and complete schedule the project manager will be unable

Scanned by CamScanner

to communicate the complete effort, in terms of cost resources, necessary to deliver the project.

b) Test Plan

Test plan is a document describing the testing scope and activities. It is the basis for formally testing any software / product in project

It identifies amongst others test items the feature to be tested, the testing tasks, who will do each task, degree of tester independence, the test environment, the test design techniques and entry and exit criteria to be used, and the rationale for their choice, and any risks requiring contingency planning. It is a record of the test planning process.

2072.

Q.12. explain the program verification and validation with examplr.

2072

Q.11. what do you mean by verification and validation? explain with example.

=>

Verification and validation are the too important aspects of software quality management. ~~Ver~~

verification gives the answer to the question whether the software is being developed in a correct way.

Validation provides the answer whether the right software is being produced.

Verification denotes precision where as validation indicates value of the end or final product. verification and validation is an important step used in various processes in different industries.

Ver - correct way

Val - right product develop

Scanned by CamScanner

verification, and validation is necessary because the designers and implementers of computer based systems are human. they will make errors. These errors will result in undetected faults in delivered systems. Faults can result in dangerous failure causing loss of life, financial loss or property damage.

The mission of V & V is therefore to find and correct errors as early as possible in the development life cycle thus preventing the delivery of a faulty product to a customer.

Q.no. 11

Explain the quality assurance plan.

→

A quality accurance plan is a document, constructed by the project team, meant to ensure the final products are of the utmost quality. A quality assurance plan contains a set of docomented activites meant to ensure that customers are satisfied with the goods or services a company provides.

There are four steps of the quality assurance process:

1. Plan →
2. Do
3. Check
4. Act

Quality assurance, or quality control, evaluates and modifies an organization's procedures to make sure they provide the desired results. A quality assurance plan should include an organizational structure, details on each employee's responsibilities, and the qualifications an employee needs to fulfill those

Scanned by CamScanner

responsibilities.

A QA plan also specifies requirements for suppliers, and the materials they ship. It specifies adequate product testing, and feeds back test result and customer complaints to solve problems and encourage improvements throughout the organization. Small businesses use quality assurance to increase efficiency and improve customer satisfaction.

An effective quality assurance (QA) program can help ensure you deliver the best possible version of your product or service on a consistent basis.

A quality plan should be designed specially for your business and improve existing procedures.

Q no. 10.
What are the stages of team formation model?

→ The stages of team formation model

1. Forming
2. Storming
3. Norming
4. Performing
5. Adjouring.

1. Forming

In this stage, most members are positive and polite some are anxious, as they haven't fully understood what work the team will do. others are simply excited about the talk ahead.

As leader, you play a dominent role at this stage, because team member's role and responsibilities aren't clear

2. Storming

This is the stage in which the member of the team all have their own ideas and directions that they want to pó. This phase can be a bit uncomfortable and unpleasent.

Scanned by CamScanner

3. Norming
This is the stage in which people start to resolve their differences, appreciate colleagues strengths, and respect your authority as a leader.

4. Performing
The team reaches the performing stage, when hard work leads, without friction, to the achievement of the team's goal.

It feels easy to be part of the team at this stage, and people who join or leave won't disrupt performance.

5. Adjouring
The team conduct an assessment of the year and implements a plan for transitioning roles and recognizing members contributions.

Q.no.9

· write the goal of software project planning.

=> Project planning is an aspect of project management that focus a lot on Project Integration. The project plan reflects the current status of all project activities and is used to monitor and control the project.

The project planning tasks ensure that various elements of the projects are co-ordinated and therefore guide the project execution.

Project planning helps in

→ Facilating communication

→ Monitoring / measuring the project progress

→ Provides overall documentation of assumptions / planning decisions

Q. no. 7.

Explain the software quality factors.

→ 1. Flexibility and Extensibility
2. Maintainability and Readability
3. Performance and efficiency
4. Scalability
5. Usability and Accessability
6. Platform compability and Portability
7. Testability and manageability
8. Security
9. Functionality & correctness

1. Flexibility & Extensibility :-
Flexibility is the ability of software to add / modify / remove functionality without damaging current system.

2. Maintainability & Readability
Maintainability focus on modification about error connections and minor function ~~modd~~ modifications,

3. Performance and efficiency
Performance is mostly about response time of the software. ~~responsible~~ This response time should be in few seconds

Scanned by CamScanner

4. Scalability

Scalability is the capacity of system, to handle a growing amount of work, i.e more hardware may be added for handling increasing user transaction.

5. Usability & Accessability

User interface must be simple. It is visible part that interact with user. Simple user interface is always best.

6. Platform compatibility and Portability

A quality software should run on as much as various platform as it can. So more people can make use of it. In different contents we may mention different platforms, this may be OS platforms, browser type etc. Portability is about adapting software that can run on different platform.

7. Security

Security is very important issue on software development, especially for web or mobile based one which may have millions of users with the ability of remote accessing to system.

2072: Q. No. 6.

Explain the cost benefit evaluation technique.

① Net profit
② Payback period } PTO
③ Return on investment.

③ **ROI**

The return on investment, also known as the accounting rate of return (ARR), provides a way of comparing the net profitability to the investment required.

To calculate the ROI, the benefit of an investment is divided by the cost of the investment. The result is expressed as a percentage or a ratio.

Scanned by CamScanner

(b) Payback Period.

The payback period is the time taken to break even or pay back the initial investment.
Normally, the project with the shortest payback period will be choosen on the basis that an organization will wish to minimize the time that a project is 'in debt'.

The payback period is the length of time required to recover the cost of an investment. The payback period of a given investment or project is an important determinant of whether to undertake the position or project, as longer playback periods are typically not desirable for investment positions.

Scanned by CamScanner

b) Test strategies

A test strategies is an outline that describes the testing approach of the software development cycle. It is created to inform project managers, testers, and developers about some key issues of the testing process. This includes the testing objective, methods of testing new functions, total time and resource required for the project, and the testing environment.

Test strategies describe how the product risks of the stakeholders are mitigated at the test level, which types of testing are to be ~~conformed~~ performed; and which entry and exit criteria apply.

They are created based on development design documents. System design documents are primarily used and occasionally conceptual design documents may be referred to.

For every stage of development design, a corresponding test strategy should be created to test the new feature sets.

Q.no.9..

what do you mean by change control.

=>

change control is a systematic approach to managing all changes made to a product or system. The purpose is to ensure that no unnecessary changes are made, that all changes are documented, that services are not necessarily disrupted and that resources are used efficiently.

The change control process is usually conducted as a sequence of steps proceeding from the submission of a change request. Typical IT changes requests include the addition of features to software applications, the installation of patches, and upgrades to network equipment.

Scanned by CamScanner

Q.no. 8. what do you mean by resource allocation?

=>

Resource allocation is the process of ~~desid~~ assigning and scheduling available resources in the most effective and economical manner.

Types The resources will fall one of the seven categories

1. Labor

The members of the project development team such as project manager, system analyst, software developers.

2- Equipment

This includes the items such as work stations and other computing and office equipment. we also count staff basic equipment's such as desk and chairs.

3. Materials

These are the items that are consumed.

Scanned by CamScanner

4. Space

To carry out any project staffs need a space where they can sit and work such as office room.

5. Time.

Time allocated to start and finish the project and its related activities

6. Money

Money is the secondary resource. It is used to buy other resources and will be consumed. It includes the initial investment

7- Service

Some of the project need services such as telecommunication services.
